Introduction

Interaction of light with matter at ultra high light intensity gives access to novel physical regimes which are barely, if at all, explored in lab.

- Intensity of $10^{23}\ W/cm^{-2}$ has been reached experimentally.[1]
- QED at $I = 10^{25} W/cm^{-2}$. Schwinger field at $I = 10^{29} W/cm^{-2}$.[2]
- Plasma is overdense if $\omega < \omega_p$.
- Harmonics are generated by interaction of laser with overdense plasma.[3]

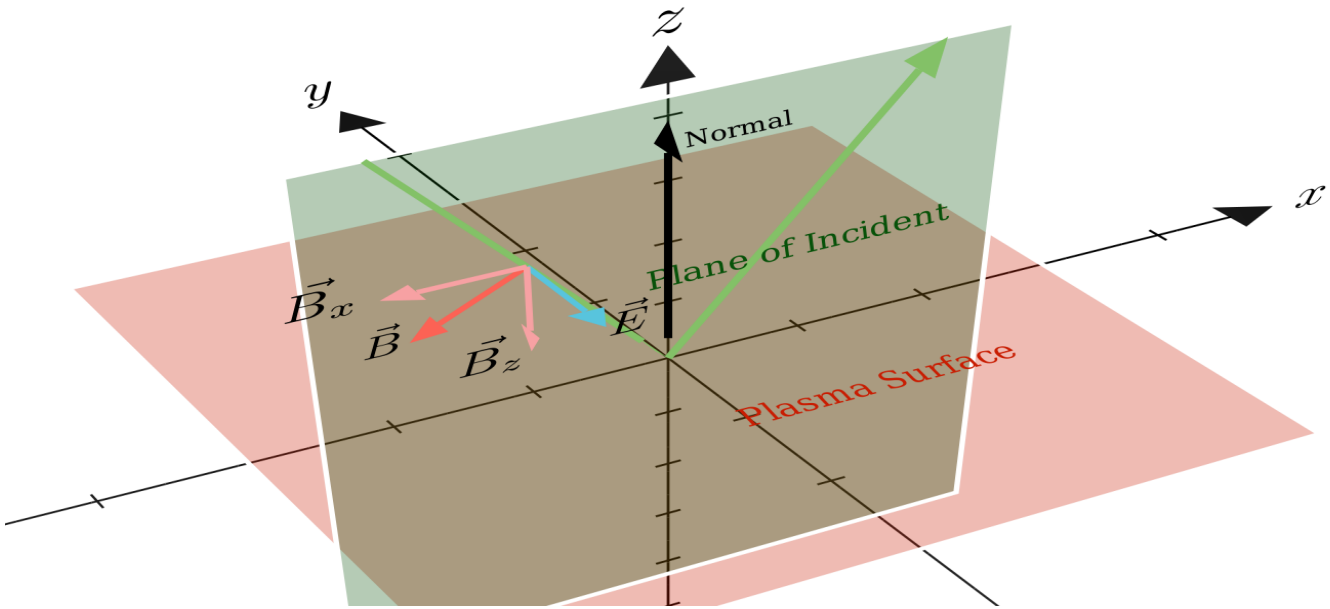
Summary of Work Done in Previous Semester

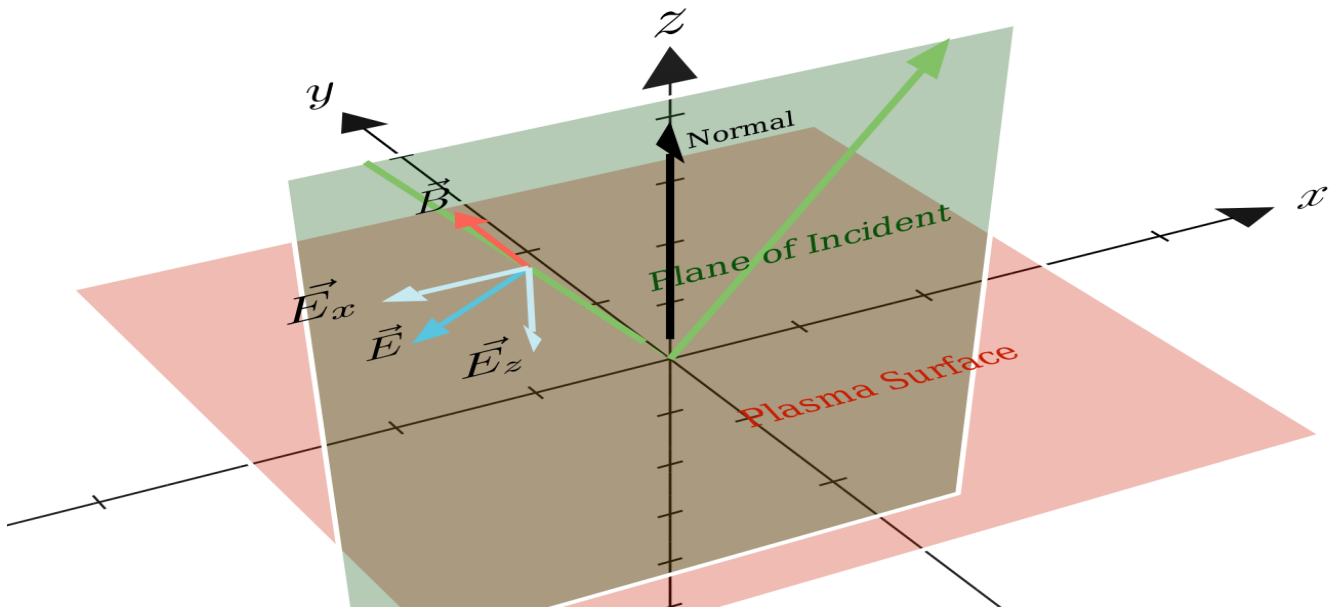
- Interaction of highly intense laser pulse with overdense and underdense plasma
- Change in effective critical density of plasma for relativistic laser pulse
- The oscillations of plasma surface.
  - Oscillations increases with increase in intensity
  - Surface oscillations have even harmonics
- Study of high harmonics generation in laser plasma interaction (normal incidence)
  - Only odd harmonics are generated
  - A resonance at $n_0/n_c = 4$ is also observed
  - Increasing intensity and pulse duration increases number of harmonics
  - No effect of the envelopes

What Now?

- A brief overview of theory related to High Harmonic Generation (HHG)
- Effect of Super Gaussian (SG) envelopes on the generated high harmonics
- Oblique incident and different polarization



S-Polarized Laser

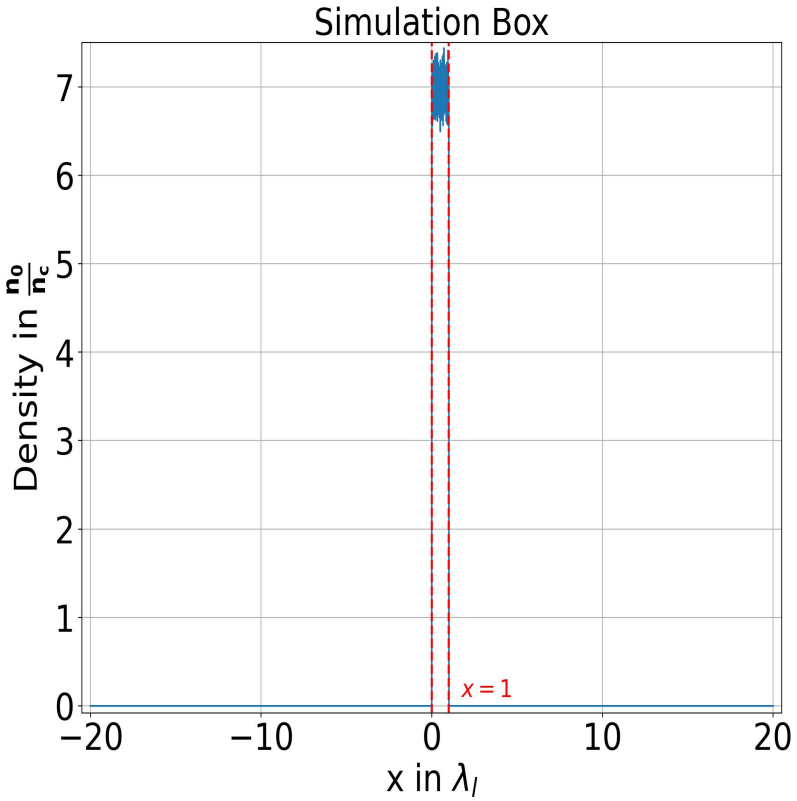


P-Polarized Laser

Simulation Details

We want to study the effect of various plasma and laser parameters on the generated high harmonics. We performed some simulations in 1D3V. The parameters which are constant throughout the entire experimentation are these:

- Particles per cell: 100
- Number of cells: 16000
- Pulse duration $= 20\tau$ ($\tau \approx 3.3fs$)
- Simulation time $= 40\tau$
- Wavelength $\lambda_l = 1\mu m$
- Intensity of laser for $a_0 = 1$ is $I = 1.37 \times 10^{18} W/cm^2$
- Some parameters are varied to study their effect on the generated high harmonics.



Current Status and Future Plan of Work

Current Status

- A brief overview of HHG generation in laser plasma interaction
- SG envelopes has very little effect on the generated harmonics
- For p-polarized laser, even and odd p-polarized harmonics.
- For s-polarized laser, odd s-polarized hyarmonics and even p-polarized harmonics.

Future Plan of Work

- Study oblique incidence and polarization more regously.
- Do 2D simulations.
- Compare it with the 1D results.

Acknowledgement
We would like to extend our sincerest gratitude to Professor Vikrant Saxena for his unwavering support, patience, motivation, enthusiasm, and invaluable guidance.
